

RAYAT BAHRA PROFESSIONAL UNIVERSITY

SEMESTER-I

Unit A -Web Design Principles and Web Page Design

Topic I-Basic principles involved in developing a web site; Planning process; Five Golden rules of web designing; Designing navigation bar; Page design; Home Page Layout; Design Concept.

Basic principles involved in developing a web site

- We explore the top 9 web design principles that will make your website aesthetically pleasing, easy to use, engaging, and effective.
- **1. Website Purpose** Good web design always caters to the needs of the user. Each page of your website needs to have a clear purpose, and to fulfill a specific need for your website users in the most effective way possible.
- **2. Simplicity** The over-designed website may not work. Putting too many elements on the page may lead to distracting visitors from the main purpose of your website.
- Simplicity always works in an effective web page design. Keep your design as simple as possible so that the visitors can feel it easy-to-use and can find their ways easily.

Principles continued...

- **3. Colour-** Finding a colour palette that fits your brand will allow you to influence your customer's behaviour towards your brand. Keep the colour selection **limited to less than 5 colours**. Complementary colours work very well. Pleasing colour combinations increase customer engagement and make the user feel good.
- **4.Typefaces & Font** No matter how good your design is text still rules the website as it provides users the desired information. Typefaces generally means a particular design of type. In general, fonts such as **Arial** and **Verdana** are easier to read online. The ideal font size for reading easily online is **16px** and stick to a maximum of **3** type faces.

Principles continued...

- **5.Imagery** Imagery is every visual aspect used within communications. This includes still photography, illustration, video and all forms of graphics. Most of the initial information we consume on websites is visual and as a first impression it is important that high quality images are used to form an impression.
- **6.Readability** Consider using fonts that are easier to read. The modern sans-serif fonts as Arial, Times new Roman, etc. can be used for the body texts. Make proper combinations of typefaces for each and every design element such as headlines, body texts, buttons, etc.

Principles continued...

- **7.Navigation** It is about how easy it is for people to take action and move around your website. Website navigation is key to retaining visitors. If the websites navigation is confusing visitors will give up and find what they need elsewhere.
- **8.Content** An effective web design has both great design and great content. Using compelling language great content can attract and influence visitors by converting them into customers like Mytra, Amazon, Flip cart etc.

Principles continued...

- **9. Load Time** Everybody hates a website that takes ages to load. Waiting for a website to load will lose visitors. Nearly half of web visitors expect a site to load in 2 seconds or 3 seconds.
- **10. Mobile Friendly** (Responsive Web Design) More people are using their phones or other devices to browse the web. It is important to consider building your website with a responsive layout where your website can adjust to different screens

Planning process

- Planning a website can take a lot of time and effort. It can also cost money to launch a website. The two most important factors that need to be taken into consideration are time and money. During the planning process, it is a good idea to make a timeline or have a goal of how long you might need to spend on each step.
- Before launching a website, the planning process is vital to ensuring everything goes smoothly down the road.
- The purpose of development planning is to make sure nothing is forgotten.

Planning process continued...

- There are seven steps that should be followed from start to finish when developing a website.
- 1. Research and goal setting
- 2. Planning
- 3. Designing the layout
- 4. Writing the content
- 5. Coding
- 6. Testing and launching
- 7. Maintaining

Planning process continued...

- **1. Research and Goal Setting**
- It is important to do proper research and set goals before beginning.
- The planning and goal setting process could take about 1-2 weeks to complete. There are a few questions you should ask yourself during this phase:
 - • What do I hope for my website to accomplish?
 - • Who is the audience I would like to target?
 - • What are the main goals of the website?

Planning process continued...

- **2. Planning the Site**
- This is an important step because it is kind of like the skeleton of your site. This process can take about 2-6 weeks to complete. The sitemap allows the developer to get an outline of what the site will look like, what pages there will be and how they will interact with each other.
- **3. Designing the Layout** This is the step where you get to be creative with pictures, videos and what kinds of things the customer will notice when they come to your site. This process can take about 4-12 weeks from start to finish. Consider colors, logos, and anything that will encourage your audience to interact with the site.

Planning process continued...

- **4. Writing the Content** The written content of a website is so important to its success. It is one that is crucial and deserves a lot of expertise. It could take from 5 to 15 weeks. A website should have a vocabulary that the average person can understand.
- **5. Coding the Website** This phase involves having a deep understanding of the technology you are using. You need a developer to write code for your website.

Planning process continued...

- **6. Testing and Launching** Before the website is launched, it is crucial that it is tested out by real users. All the links and content should be tested to see if it works. Don't just check the website once, but check it over multiple times. When you are confident that everything is in working order, you can go ahead and launch your website live. Testing and launching may take 2-4 weeks to complete
- **7. Maintenance** Since technology and products are changing more rapidly than ever before, it is important to stay up-to-date with what is happening on the internet.

Five Golden rules of web designing

Five **Golden Rules** Of Web Designing

Golden rules continued...

- **1. Keep it simple**
- One of the most important things to remember when designing your website is to keep it simple. Users should be able to find what they're looking for quickly and easily without being bombarded with too much information.
- **2. Make It Easy to Use**
- Your website should be easy to use for all users, regardless of their level of technical expertise. Navigation should be user-friendly, and all features should be easy to understand and use.

Golden rules continued...

- **3. A good website should be easy to navigate.**
A website that is easy to use is crucial because if the visitor finds it difficult to navigate from one page to another, he or she will get frustrated and leave the website. Attracting frustrated visitors to come back to visit the site is extremely difficult.
- **4. URL should be easy to remember**
One of the most common mistakes in website design is choosing a proper domain name. Your domain name should be easy to remember and easy to spell. The most commonly used format is `www.[organization name].org`, for example, www.sunnyvillerotary.org.

Golden rules continued...

- **5. Responsive Design**

- In the early days of the web, most people were using desktop computers. These days the web is available on desktops, laptops, tablets, foldable phones, fridges, and cars. People rightly expect that websites look good no matter what device they use. Responsive design makes this possible.
- Responsive web design (RWD) refers to designing websites to adapt to a user's device.
- Responsive web design responds to user needs by adapting to different screen sizes, orientations, layouts, and platforms.

Designing navigation bar

A **navigation bar** is a user interface element, typically found at the top or side of a website or application, that provides links to different sections or pages. It helps users easily navigate and find what they're looking for. Think of it as a roadmap for exploring a website or app.

It also enables you to take your visitor on a journey, from the most important pages at the top-left of the navigation menu to the lesser important pages at the top-right of the navigation menu.

Designing navigation bar continued...

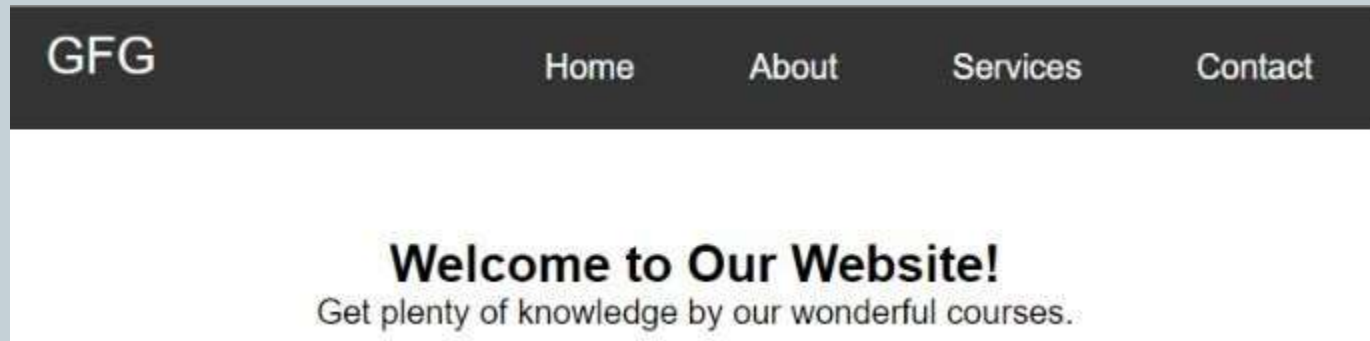

- **Location & Types: :**
- They are commonly positioned at the top or side of the screen, but can also appear at the bottom in some mobile interfaces.
- Navigation bars can be static (stay in the same place) or dynamic (changing based on user interaction or screen size). Examples include:
 - **Top Navigation:** Common on websites, often with a logo on the left and navigation links on the right.
 - **Side Navigation:** Often used in applications, especially on larger screens, to organize content into categories.
 - **Bottom Navigation:** Common in mobile apps, providing quick access to key destinations.
- **Content:**
- Navigation bars usually contain links to main sections like "About Us," "Products," "Contact," or other important pages.

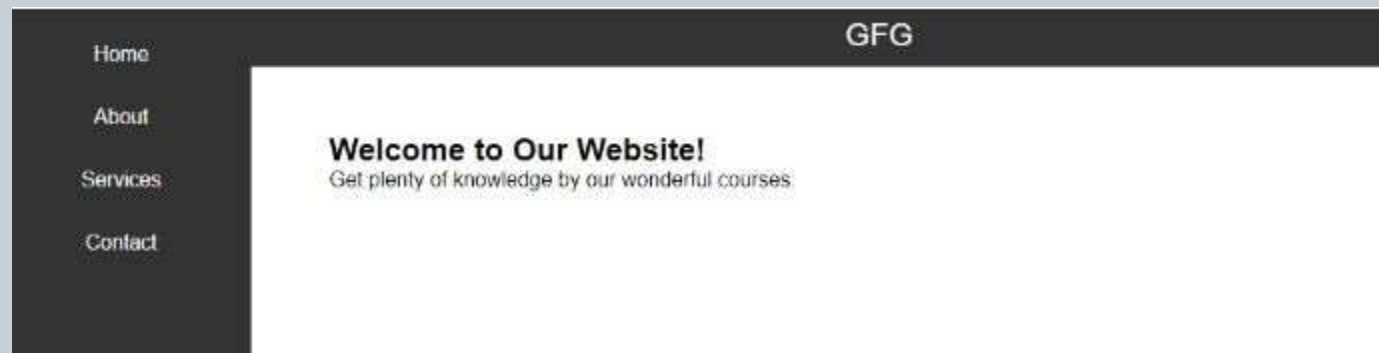

Two main types of Navigation Bars

- **Horizontal Navigation bar:**

- **Vertical Navigation Bar:**

Navigation elements are important components of web design that allow the functionality of navigation throughout the website with the help of simple buttons, menus, links, tabs, etc.

TYPES OF NAVIGATION ELEMENTS:

- 1) Horizontal Navigation Bar**
- 2) Vertical Navigation Bar**
- 3) Dropdown Navigation Menu**
- 4) Hamburger Navigation Menu**
- 5) Breadcrumb Navigation**
- 6) Tab Navigation**

Two main types
of Navigation
Bars

What Are Navigation Elements

1) Horizontal Navigation Bar

It is a row of different links that link the main categories of the website horizontally and placed at the top or down of the website. I will try to provide examples from Rayat-Bahra Professional University website so you can understand properly. For example, in RBPU the Black colored bar below RBPU logo where main categories are provided like HOME, ABOUT , Academics etc. is a Horizontal bar. Its a simple element most used in all websites for representing categories.

What Are Navigation Elements

**HORIZONTAL
NAVIGATION BAR**

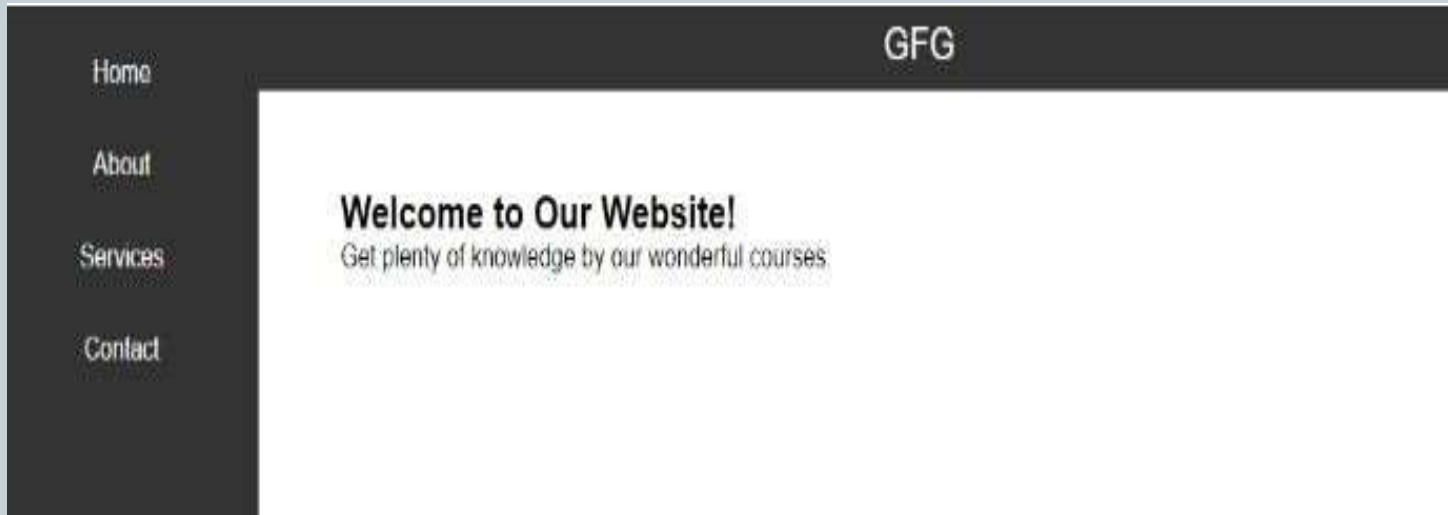

What Are Navigation Elements

2) Vertical Navigation Bar

A **vertical navigation bar** (also called a **sidebar navigation** or **vertical navbars**) is a user interface element that displays navigation links in a **top-to-bottom column**, usually on the **left** or **right** side of a webpage.

Navigation Elements

A menu is a structured list of links grouped together, often used to show multiple navigation options compactly.

3) Dropdown Navigation Menu

A **dropdown navigation menu** is a type of menu that displays additional navigation options when a user interacts with a parent item—typically by **hovering** over or **clicking** it. It's widely used in web design to organize links under categories without cluttering the main navigation bar.

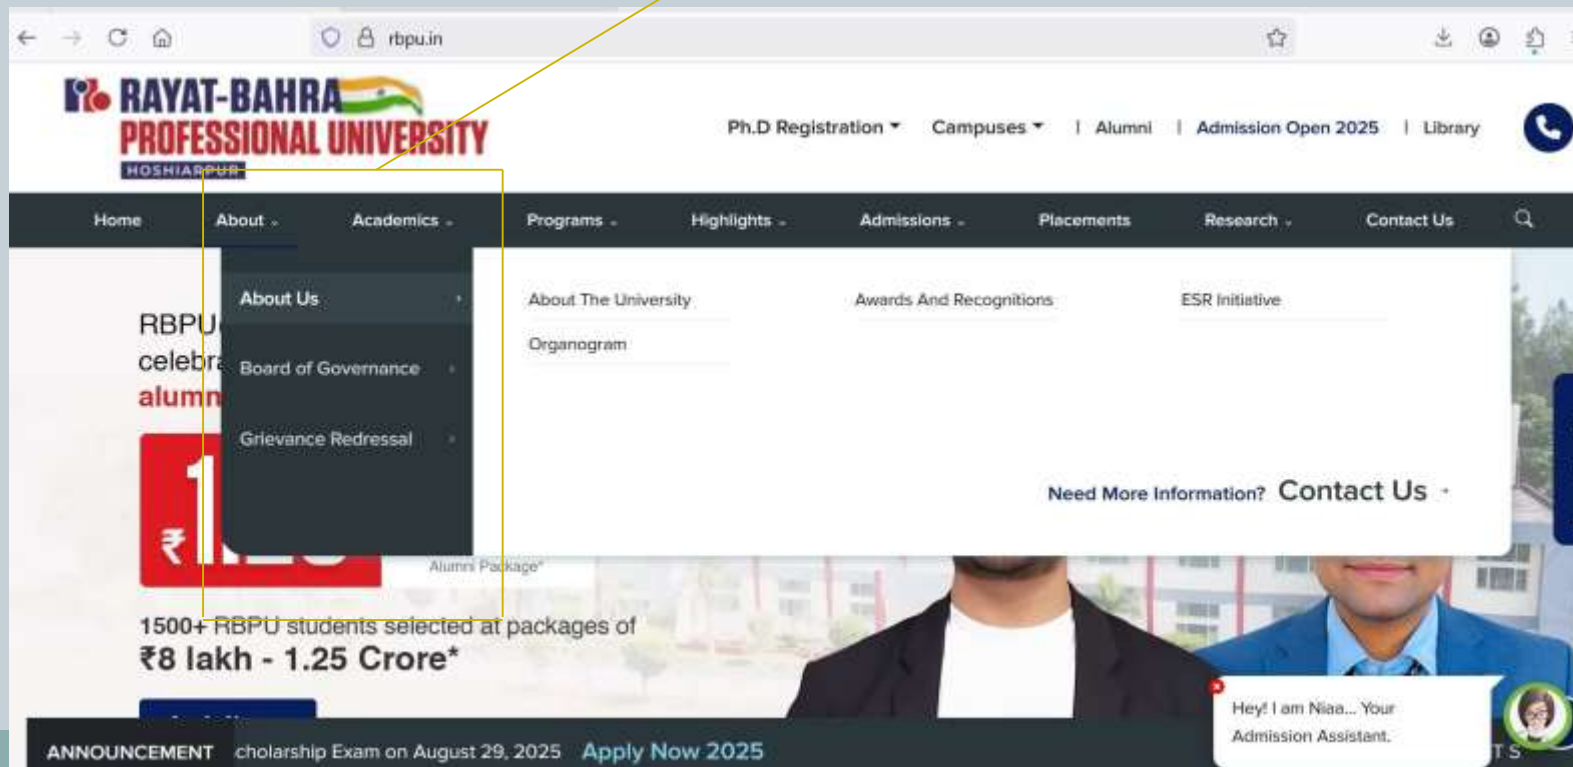

Navigation Elements

3) Dropdown Navigation Menu

**DROPDOWN
NAVIGATION BAR**

Navigation Elements

4) Hamburger Navigation Menu

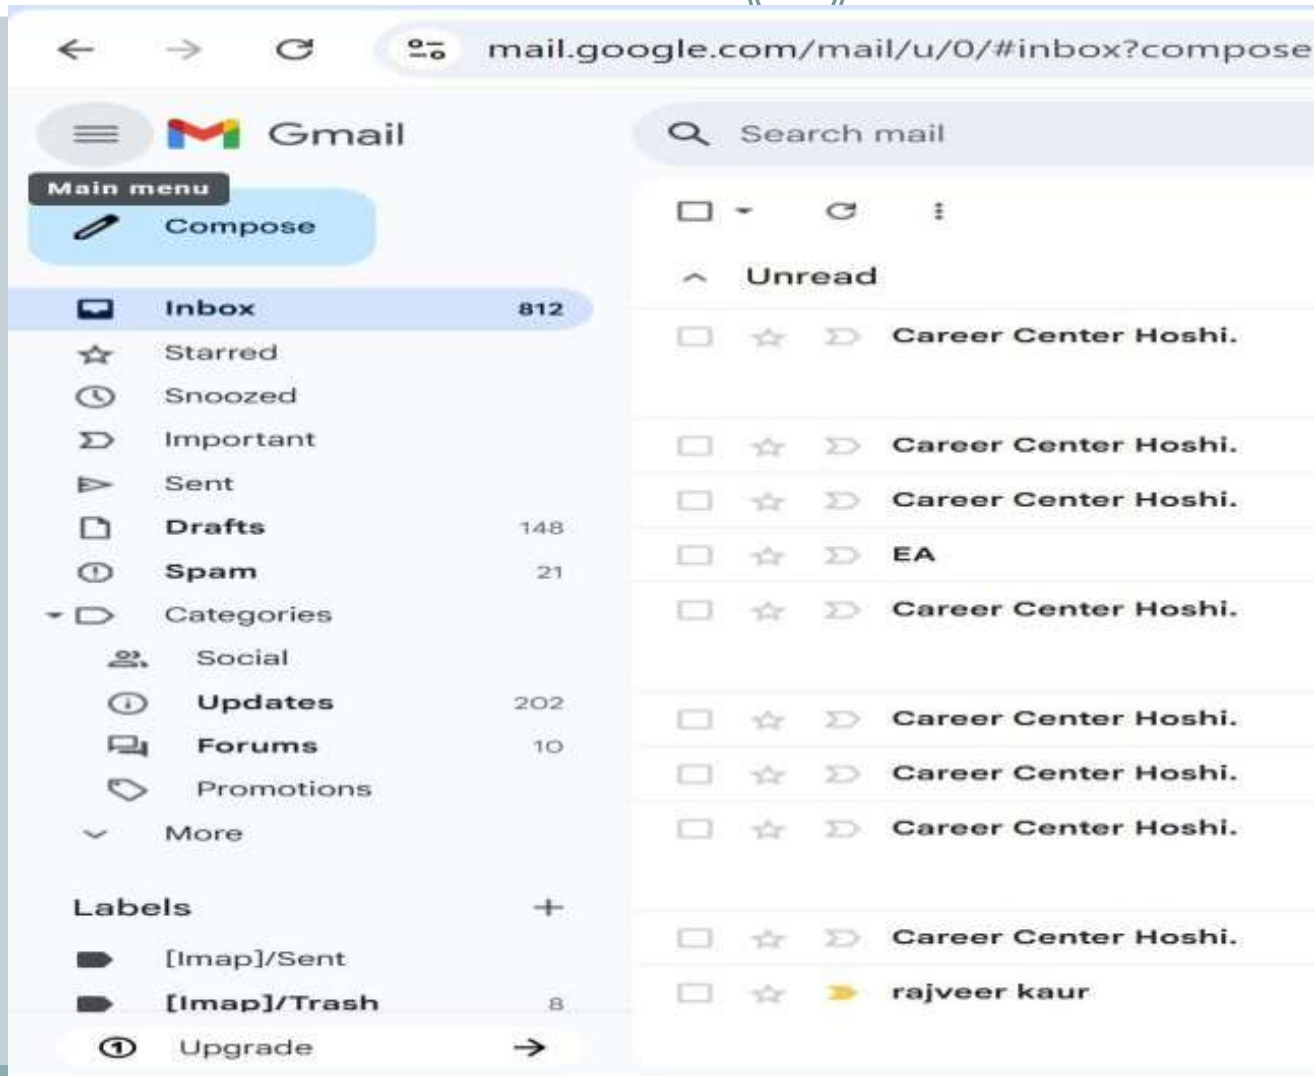

- ❑ This is a type of navigation menu that consists of **three horizontal lines that are stacked on top of each other, generally placed at top right or left of site.**
- ❑ It is usually when the user clicks on it, it slides out a sidebar or a full-screen overlay that contains the navigation links or buttons. A hamburger navigation menu is commonly **used for mobile devices or websites that have a minimalist design.**

A **hamburger menu** is a button or icon that, when clicked, reveals a hidden menu (usually vertical). It helps **save screen space** and keeps the interface **clean**, especially on **mobile devices**.

Navigation Elements

4) Hamburger Navigation Menu

Navigation Elements

5) Breadcrumb Navigation

It is not primary but a secondary navigation which can be used by users or search engines for knowing the path of webpage from homepage, like you first open some website then click on genre and from there you click on Shooting which opens shooting games so breadcrumbs will be shown like

Home>Genre>Shooting

It can appear on top or bottom of page, It is very useful for websites and good for SEO.

Navigation Elements

6) Tab Navigation

Tab navigation is a UI design pattern that allows users to **switch between different sections or views** of content **without reloading the page**. It works like the tabs in a file folder or browser window — clicking a tab shows new content while hiding the rest.

Its a navigation which divides the whole content in form of tabs. Tab switching buttons or links are placed generally at top or bottom of page. We can switch between different tabs b clicking on buttons. For easy understanding just take example of Youtube, when you open youtube in mobile below there are buttons like **Home, Shorts, Subscriptions** etc. and on clicking them you can switch between different tabs or different content that is called Tab Navigation.

Design Concept

- A web page is a single, standalone document on the internet, while a website is a collection of related web pages, all accessible under a single domain name.
- **Web Page:**
- A webpage is a document formatted with HTML (or other web languages) and displayed in a web browser. It can contain text, images, videos, and interactive elements. Each webpage has a unique URL (web address).
- **Website:**
- A website is a collection of interconnected web pages that are all related to a specific topic or purpose. It is accessed through a single domain name (e.g., [google.com](https://www.google.com)). For example, a news website (the website) would have different webpages for the homepage, different news categories, and individual articles

Page design

- **Page design** in website refers to the visual layout and arrangement of content on a webpage. It involves how text, images, graphics, and other elements are positioned to create a visually appealing and user-friendly experience.
- Effective page design ensures easy navigation, clear information presentation, and a positive user experience .

Home Page Layout

- The **Home page** is one of the most important pages of any given website.
- It serves as **a reception** for the website.
- The Home page is often considered the “**front door**” of a website also called **landing page**.
