

Subject Name-WEB DESIGNING

Course Code:-BECS25-103

UNIT-E

Introduction to Web Publishing or

UNIT- E

- **Creating the Web Site**
- **Saving the site**
- **Working on the web site**
- **Creating web site structure**
- **Creating Titles for web pages**
- **Themes-Publishing web sites**

Introduction

- A common Internet service is **web hosting**
- Web hosting means **storing your web site on a public server**
- Web hosting normally includes **email services**
- Web hosting often includes **domain name registration**

Introduction

WEBSITE:

A website can be defined as a collection of several webpages that are all related to each other and can be accessed by visiting a homepage, using a browser like Internet Explorer, Mozilla, Google Chrome or Opera.

WEB DEVELOPMENT:

Web development is basically the tasks associated with developing websites for hosting via intranet or internet. The web development process involves web design, web content development, client-side/server-side scripting and network security configuration.

Web hosting

- Web hosting is **a service that allows organizations and individuals to post a website or web page onto the Internet.**
- A web host, or web hosting service provider, is a business that provides the technologies and services needed for the website or webpage to be viewed in the Internet.
- Websites are hosted, or stored, on special computers called servers. When Internet users want to view your website, all they need to type your website address or domain into their browser. Their computer will then connect to your server and your webpages will be delivered to them through the browser.
- Most hosting companies **require that you own your domain in order to host with them.** If you do not have a domain, the hosting companies will help you to purchase.

Definition

➤ WEB HOSTING:

Web Hosting, as the name suggests, is a type of internet *hosting that allows one to make their website available to users through WWW using the internet.* It simply provides space to the website on a web server so that files or data of the website can be stored. It is the best way to increase the growth of business and user experience.

➤ WEB PUBLISHING:

Web Publishing, as the name suggests, *is the process of creating a website and placing it on the webserver, and published content may include text, images, videos, and other types of media.* Its main aim is to facilitate communication simply by adding context through style, emotion, and space. It is also known as online publishing.

Definition

- Hosting your website on your own server could be much expensive.
- Buying a server space or renting a complete server from an Internet Service Provider (ISP) is the most widely used option.

Some of the web host providers are

- BigRock
- Hostinger
- Bluehost
- GreenGeeks
- DreamHost
- WPX
- GoDaddy

How to Setup a Website?

- A website is composed of several elements and while setting up a website, you would have to take care of each of them.
- To set up a website and make it live, you should first purchase a **hosting plan**. **Select a domain name** for this website.
- Point the DNS records to the server or the hosting provider.
- Develop the content that you want to publish on the website.
- Check if you need to purchase a public certificate and install it.
- Publish the webpage on the Internet.

Domain Name Registration

- This is one of the important steps to buy a domain name.
- A *domain is the name of your website*. It has to be unique and convey the brand of your business.
- The easiest way to search and register a domain is to go to a domain registrar.
- A domain registrar like [GoDaddy](#), will let you register your domain name either through yearly contracts or a long-term contract.
- When you buy a domain name it is registered and when domain names are registered they are added to a large domain name register, and information about your site – including your Internet IP address is stored on a DNS server and your contact information etc. is registered with your registrar.

Domain Name Registration

- Some of the biggest registrars where you can register your domain are given below –
- GoDaddy - with the URL <https://uk.godaddy.com>
 - Name - with the URL <https://www.name.com/>
 - iPage - with URL <https://www.ipage.com>
 - BlueHost - with URL <https://www.bluehost.com/>
 - Hostgator - with URL <https://www.hostgator.com/>

Tools for web hosting

The following tools and infrastructure will help you in developing a Website

1. Computer Machine
2. Internet Connection
3. A Web Server - need one Web Server to keep all the files related to your Website.
4. A Text Editor
5. A Web Browser
6. Secure FTP client

Methods

There are three ways to make a website:

- **Creating from scratch**
- **Using a content management system (CMS)**
- **Using a website builder**

Methods

➤ Creating a website from scratch

Required knowledge about HTML, CSS, Scripting languages, database.

1. Setup a local working environment

➤ create a web development environment on your computer device by installing an IDE (Integrated Development Environment). An IDE basically consists of a Text Editor, a Build Automation and a Debugger.

➤ Eg-Visual studio code, Sublime text, Atom, Adobe Dreamweaver.

2. Plan and Design your website using HTML, CSS and make it dynamic using javascript

3. Upload Local Files to the Server using FTP Client

Methods

➤ Creating a website from scratch

- First, download an FTP client on your computer device and connect it to your web server using an FTP account.
- After you have successfully connected it to the FTP account, copy all your local files to the root of your web directory.
- Some good FTP clients are [FileZilla](#), [WinSCP](#) and [Cyberduck](#).

Methods

➤ Creating a website with CMS

- Required knowledge about HTML, CSS, and PHP and Tools like WordPress, Joomla, Drupal
- WordPress is a free and open-source content management system written in PHP and paired with a MySQL .
- It is a software application that makes it easy to create and manage online contents.
- Most of the tools are open-source and free to use.

Methods

➤ Creating a website with CMS

Step-by-step website creation process using WordPress

Step 1. Find the WordPress installer in your web hosting panel

- Web hosting services usually feature a quick installer for installing WordPress and other common platforms.
- So login to your web hosting account and find out which installer you have.
- The popular names you should search for are Softaculous, QuickInstall, or Fantastico.

Step 2: Install WordPress through the installer

Softaculous is the most popular auto installer and it is featured on cPanel. I will walk you through the installation via Softaculous. The other installers are pretty much the same.

Methods

➤ **Step 3: Install a theme and some important plugins**

Next, you have to install a theme and the must-required plugins. Have a look at the left sidebar of your WordPress Dashboard.

➤ **Step 4: Then you are ready to use the website.**

Methods

➤ Creating a website using website builder

A website builder is a one-stop solution platform to create websites quickly and simply. While a CMS can significantly simplify website creation, website builders are even easier to use. Some examples of website builders are Zyro **Squarespace**, and **Weebly**.

➤ Basic knowledge of computer and Internet

Tool are: Zyro, Wix and Weebly

➤ Site builders have made it effortless and instant to setup a website

➤ They offer Drag & Drop website builders which require zero coding knowledge.

Saving the website

- **Open the webpage that you want to save.** Press Ctrl+S (PC)
- **Select a location to save the page**
- **Choose a saving format.** The options for saving the page vary depending on the browser you're using:
 - **Chrome and Edge:**
 - **Webpage, single file** creates one file (with the .mhtml file extension) that contains the current page's contents and images. This is a great choice to capture everything at once.
 - **Webpage, complete** also downloads the entire webpage, but places all images into a separate folder.
 - **Webpage, HTML only** saves the HTML code, which doesn't include any images—just the raw code, which you can use as reference for your own webpages.
- **Now open the saved webpage.**

Working of website

- A user enters a URL into a browser (for example, [Google.com](https://www.google.com)). This request is passed to a domain name server.
- The domain name server returns an IP address for the server that hosts the Website (for example, 68.178.157.132).
- The browser requests the page from the Web server using the IP address specified by the domain name server.
- The Web server returns the page to the IP address specified by the browser requesting the page. The page may also contain links to other files on the same server, such as images, which the browser will also request.
- The browser collects all the information and displays to your computer in the form of Web page.

Website structure

- A site structure is how the different pages on your site are linked with each other using internal links and their hierarchy. It is how the information on your site is organized and presented so that it is easy to read its context well.
- Good website structure facilitates easy navigation for both users and crawlers which improves the SEO (Search engine optimization) ranking of your website in search engines.

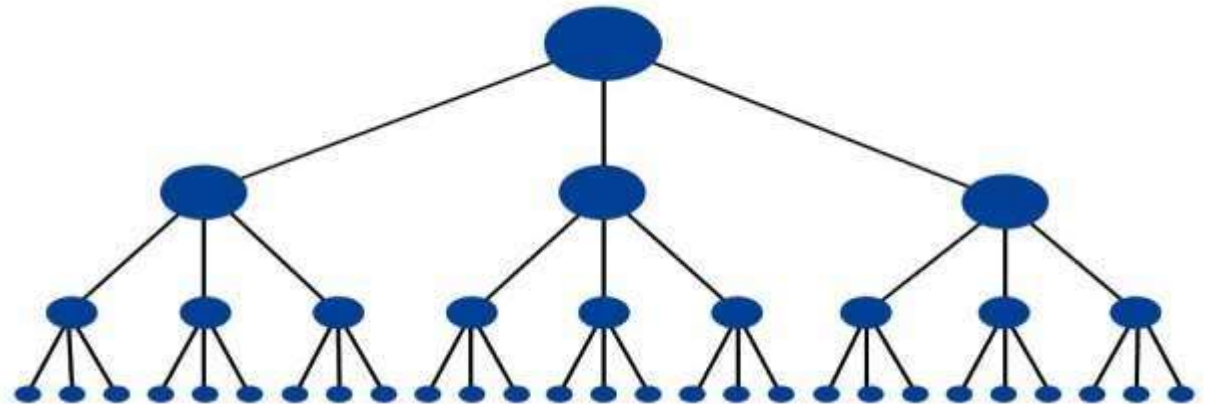

Steps to create a website structure

➤ Plan out a hierarchy before you develop your website.

A “hierarchy” is nothing more than a way to organize your information — something that is simple and makes sense. Your hierarchy will also become your navigation and your URL structure, so everything important begins here.

Generally, a site hierarchy looks like this:

Steps to create a website structure

1. There are a few features of hierarchy that you should keep in mind.

- Make your hierarchy logical.
- Keep the number of main categories between two and seven.
- Try to balance the number of subcategories within each category

A site hierarchy is the beginning point for a great site structure.

2. Create a URL structure that follows your navigation hierarchy.

The second main element in developing strong site structure is your URL structure. If you've logically thought through your hierarchy, this shouldn't be too difficult. Your URL structure follows your hierarchy.

Steps to create a website structure

1. There are a few features of hierarchy that you should keep in mind.

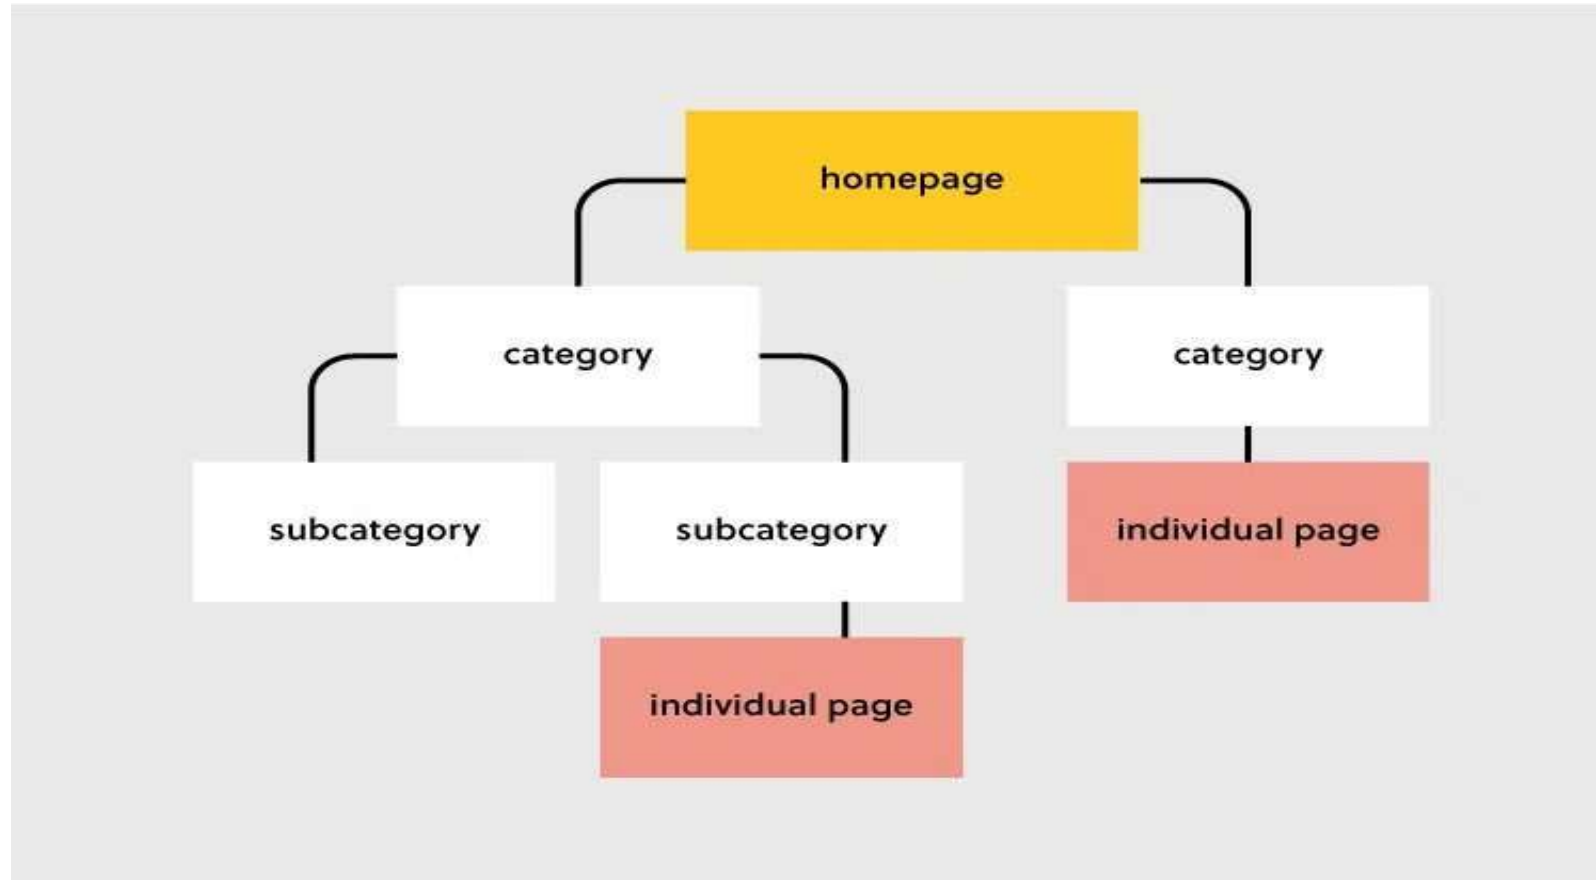

- Make your hierarchy logical.
- Keep the number of main categories between two and seven.
- Try to balance the number of subcategories within each category

A site hierarchy is the beginning point for a great site structure.

2. Create a URL structure that follows your navigation hierarchy.

The second main element in developing strong site structure is your URL structure. If you've logically thought through your hierarchy, this shouldn't be too difficult. Your URL structure follows your hierarchy.

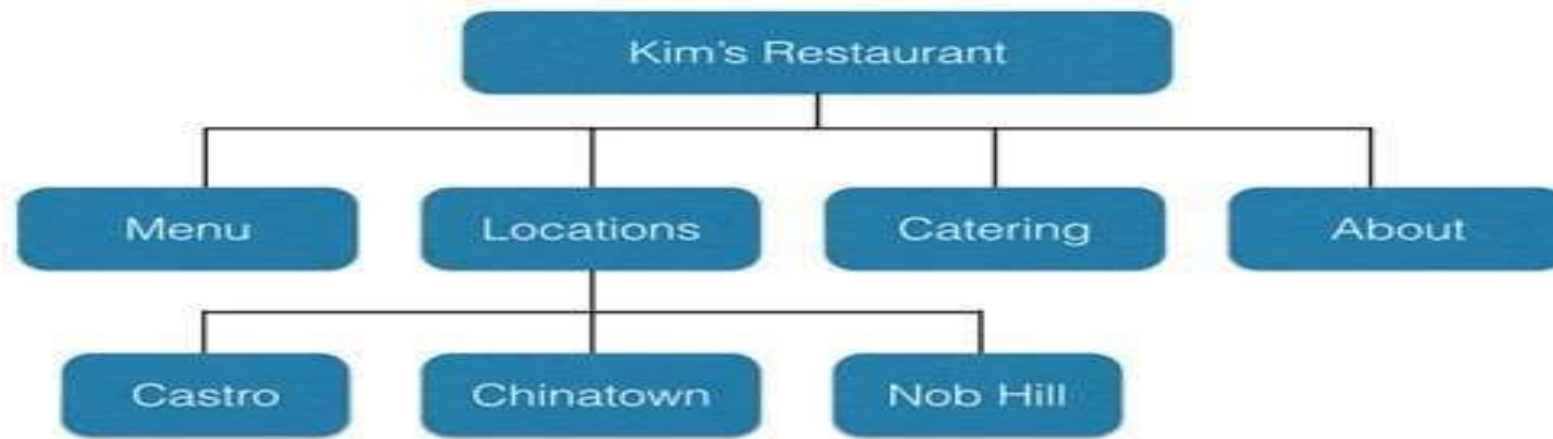

Example – site structure

Steps to create a website structure

- So, let's see the example hierarchy looks like this:

- The URL structure for the Chinatown location would look like this: www.kimsrestaurant.com/locations/chinatown
- Your URL structure will be organized according to your site hierarchy. This means, obviously, that your URLs will have real words (not symbols) and appropriate keyword coverage.

Steps to create a website structure

3. Create your site navigation in HTML or CSS.

When you create your navigation, keep the coding simple. HTML and CSS are your safest approach. Coding in JavaScript, Flash, and AJAX will limit the crawler's ability to cover your site's well-thought-out navigation and hierarchy.

4. Use a shallow depth navigation structure

- ✓ Your navigation structure will obviously follow your site hierarchy. Make sure the pages, especially important ones, aren't buried too deep within the site. Shallow sites work better, both from a usability and crawler perspective
- ✓ *A shallow website (that is, one that requires three or fewer clicks to reach every page) is far more preferable than a deep website (which requires lengthy strings of clicks to see every page on your site).*

Steps to create a website structure

5. Create a header that lists your main navigation pages.

Your top header should list out your main pages. Use a very simple top navigational footer with minimal subcategories.

6. Develop a comprehensive internal linking structure.

- ❑ Internal linking puts meat on the bones of a logical site hierarchy.
- ❑ There are some reasons why the internal linking are important:
 - They allow users to navigate a website.
 - They help establish information hierarchy for the given website. They help spread link (ranking power) around websites.
 - Each of these is directly tied to creating a tight-knit and well-integrated site structure.

Steps to create a website structure

- There's no need to get complicated with internal linking.
- Internal linking tells the search engines what pages are important and how to get there. The more internal linking you have across all pages, the better.

7. Create a Sitemap For Your Website

- If you have done all of that, you can plan out the sitemap too. It's basically all of your website's pages in one file that gets constantly updated.
- It also helps search engine to index your pages faster

Thus, the best time to develop a strong site structure is before you create your site. However, if you're redesigning your site, you can rework the design and reorganize some navigational elements to improve structural SEO.

Creating Titles for web pages

➤ **Website title:**

A web page title, or title tag, is the value you assign the <title> tag that's typically appear on top of an HTML/XHTML document inside the <head> tag. A website title is useful for both users and search engines.

➤ Web titles are one of the most powerful on-site search engine ranking factors that you have control over. The title of your page is the entry point to your site, much like the storefront of your business. A poorly written web title can actually push people away from your website, and vice versa, a killer title can attract more visitors can boost your site ranking.

Creating Titles for web pages

- Good page titles can increase traffic and qualify your visitors.
- A Web page's title has two main functions:
 1. To explain what the page contains, and
 2. To promote keywords or phrases and thus increase and qualify traffic.
- A page's title is the most important part of what makes a user click a link in a list of search results.

Website title - Example

HostGator | Website Hosting Services - Easy & Secure Hosting

<https://www.hostgator.com/> ▼

HostGator is a leading provider of secure and easy website hosting services. Discover why thousands of customers trust us to handle their hosting needs.

On your website, the title shows up in the tab at the top of the browser.

Creating Titles for web pages

COMMON MISTAKES WITH WEB PAGE TITLES

1. Not having a title

There are lots of websites that do not have a title or “Untitled Document” are named as default

2. Too short or too long page title

Google can display up to **50-60** characters in the search result page

3. Keyword Cannibalization

keyword-stuffing or keyword cannibalization is used by a few SEO consultants to improve their SEO rankings. If you have multiple pages competing for the same (or very similar) keywords/keyword clusters, you are in the trap of keyword cannibalization.

Creating Titles for web pages

4. Using the company/site name in all of your web page titles

It would be much more better to locate your company name in the home page or contact page, but avoid them in the content page if it is **too long**.

Creating Titles for web pages

5. Duplicate web page titles

- Two or more pages with the exact similar content and page title, but having different URLs
- Two or more pages with similar page titles but having different content on the pages
- The news archive has pagination pages that all have the same title.

Steps for Writing Title Tags

1. Write unique titles for every page.

Having a clear and accurate title helps both search engines and online users understand what your content is about. Remember that authenticity and uniqueness are crucial to SEO title optimization.

2. Pay attention to length

you should aim for the title tags that are about 50 characters or less.

3. Use your target keyword properly (but don't overdo it).

Since Google's algorithm uses the title tag as one of the main ways to determine what a page is about, it's a good opportunity for you to **include the main keyword** or keywords you're targeting for that page. That makes it clear to Google that this page is relevant for anyone searching for that specific term.

Steps for Writing Title Tags

4. Be descriptive of what's on the page.

- your web title can show an accurate description of what people will see from your page, you can lower the website bounce rate and keep customers stay on your site longer. This results in a better shopping experience, making people want to come back for more.
- You can use words like **HOW**, **WHY**, **WHAT**, and **WHERE** to give more meanings to your page title.

5. Make a (brief) case for what's on the page.

Make sure you really think about what on the page is most valuable or important to your target audience. Your title tag should **emphasize the value your page provides to them.**

Title Tags: Short, but Powerful

Online Tools for Checking Your Title Tags

- [SEMrush Site Audit](#) — This SEMrush tool checks will help you identify problems on the website, while also showing you duplicate titles or [meta descriptions](#) on the website. You will also see pages that are missing title tags.
- [Content Audit](#) — This tool provides a table to analyze the content from a written text perspective as opposed to a technical SEO perspective like the Site Audit tool. After this tool has crawled the site, you can export the report to XLSX and have a file with all of the existing pages along with their titles and meta descriptions.
- [Yoast Plugin for WordPress](#) — This plugin checks your [on-page SEO](#), [offers suggestions for page titles and descriptions](#), and even features a snippet editor to test out how your result will look in Google.

Summary - creating tiles for website

- Keep titles about 55-60 characters long
- Use target keywords in titles.
- Describe your page content in the best
- Use words like HOW, WHY, WHAT, and
- WHERE - help people understand what they will find on the page.
- Use words like BEST, REVIEW, and
- ULTIMATE - entice users to click. Write unique titles, no duplicates!
- Use your company name or brand wisely. Keep it simple.

Themes-Publishing web sites

- A theme changes the design of your website, often including its layout. Changing your theme changes how your site looks on the front-end, i.e. what a visitor sees when they browse to your site on the web.
- There are thousands of free WordPress themes in the [WordPress.org Theme Directory](#), though many WordPress sites use custom themes.
- A theme is a zipped folder with a group of files, including a set of page templates written in the [PHP](#) programming language combined with some [CSS stylesheets](#).
- Themes customize the appearance of your site, including the layout, typography, color, and other design elements.

Themes-Publishing web sites

- When you first [create a WordPress site](#), it will come with a [default theme](#) installed. You can change the theme in WordPress to match your needs and industry.
- Choosing the right theme can make your website more attractive, easier to use, and improve visitor engagement.

What the themes do?

- Themes take the content and data stored by WordPress and display it in the browser. When you create a WordPress theme, you decide how that content looks and is displayed. There are many options available to you when building your theme. For example:
 - ❑ Your theme can have different layouts, such as static or responsive, using one column or two.
 - ❑ Your theme can display content anywhere you want it to be displayed.
 - ❑ Your theme can specify which devices or actions make your content visible.
Your theme can customize its typography and design elements using CSS.
 - ❑ Other design elements like images and videos can be included anywhere in your theme.

Steps to follow for choosing a theme for website

- Make a list of the features you want ahead of time
- Don't choose a bloated theme.
- choose a responsive theme.
- Keep color in mind.
- Consider buying a premium theme.
- Don't choose a theme with a font that's hard to read.
- Test the theme thoroughly.

How Does WordPress Theme Work?

- ❑ A WordPress theme is a folder of files that work together to create the design of your site. A theme includes template files, stylesheets, images, and possibly JavaScript files. All those files change how your blog posts and pages are displayed.
- ❑ Changing your WordPress theme won't necessarily change your blog content, [pages](#), users, or other information stored in your [database](#).
- ❑ Your theme only changes how all that information is displayed to your website visitors.
- ❑ There are thousands of free and premium WordPress themes available for you to use.

There are three ways that you can install a WordPress theme:

- Choose one from WordPress theme directory
- Upload a custom / premium WordPress.
- or add a new theme using FTP.
